GFRC / Glass Fiber Reinforced Concrete

* Commercially, GFRC is used to make large, lightweight panels, columns and moldings profiles that are often used as facades.

* A GFRC systems are considered non-structural, in that they are designed to support their own weight.

* The GFRC systems are considered lightweight because of the thinness of the material, not because GFRC concrete has a significantly lower density than normal concrete.

* Many architects and builders are now starting to specify GFRC on their projects, and some will accept no substitution.
  
  * If you want a custom, hand-crafted Natural Stone look, then there is only one place to go.
  
  * GFRC Concepts you will find the custom-made products at the price you want to pay.
